

UCS

Universal Command Set

Workforce Management terminal software development made simple with UCS

*Put 15 years of workforce management
experience to work for you!*

UCS is software that runs on all ATS terminals allowing for rapid terminal development.

Think integrating a new terminal to your software solution is too much hassle? It isn't!

ATS has harnessed its 15 years of workforce management expertise (along with its over 150,000 terminal installations) into a high-level "command" language that allows for the rapid development of a time and attendance, workforce management, and/or employee self service terminal applications. All common and not-so-common workforce management features and rules are included ensuring that no matter what your solution requires, terminal integration will be quick and painless.

UCS Features:

Communications/Operations

- On-line interactive, batch mode, or Internet mode
- Complete control over the entry, filtering, and validation of data
- Easily assign function keys
- Validation tables (up to 99 total) to easily manage schedules/employees/departments
- Biometric template management (fingerprint and finger geometry)

Workforce Management

- Four levels of supervisor override capability
- PIN can be required for any function for selected or all employees
- Grace periods can be defined for meals and breaks
- View schedules, week-to-date hours, last punch, and much more

Universal Command Set (UCS)

Communications and Operations

Define commands by transaction type: on-line interactive or batch mode (local or remote validation).

Internet terminal mode gives you greater flexibility because, unlike standard serial or Ethernet connection modes, the terminal does not need to stay connected. It can connect on demand or at pre-scheduled times, freeing up network resources. DES encryption is supported.

Swipe & Go or Function Key operation or combination of both [example: Start Day (In) and End Day (out) transactions are swipe & go, but a function key is used for lunch or break.]

Employee prompting: displayed messages can be changed/updated for one/all employees – multiple languages supported.

Time & Attendance Features

- Display employee name at punch.
- Define badge number length with or without padding.
- Personal Identification Number (PIN) can be required for any type of transaction for selected or all employees (example: manager must enter a PIN for punch override).
- Supervisor levels – up to 4 levels can be linked to an employee to control schedule overrides, missed punches, and biometric enrollment.

Employee Schedules can be set up to restrict the times an employee can punch In or Out. Each employee can be attached to a restriction schedule that can have up to 8 time zones set up. Advanced features include time grace periods, time frames linked to function keys (so that function keys can be used only at defined times), and lunch/break lengths can be set with grace periods to eliminate short/long breaks.

DISPLAY:	Review schedules, week-to-date hours, last punch.
JOB/DEPARTMENT TRANSFERS:	Validation tables can be populated that allow the user to change Job or Departments, enter work orders, or other information.
RING BELLS:	Actuate bells/alarms up to 50 times a day with a defined duration for each scheduled time.
BIOMETRICS:	Set verification level globally or for an individual.
GUEST LIST:	A valid table of badges can be set up for visiting employees with expiration dates.
DAYLIGHT SAVING TIME:	Terminal will automatically adjust for Daylight Saving Time anywhere in the world.
MODEM AUTO DIAL:	Define how and when the modem will establish data link to host.
LAST PUNCH TIME OUT:	Restricts employee from double punching by not allowing the employee to use the terminal for a defined period of time from the last punch.
